Project Description	The Project activity consists of the installation and operation of a new absorption column at Ascend's adipic acid plant in Cantonment, FL. The column converts NO _x to nitric acid via a high-pressure water absorption process. This absorption column allows the plant's Thermal Reduction Unit (the control unit or TRU) to accept a higher percentage of the adipic off gas flow from the adipic acid plant rather than directing it to the non-N ₂ O emissions control unit (the NO _x -specific selective catalytic reduction unit or SCR). Longer TRU operating times result in more N ₂ O destroyed. Per the Protocol's definition for eligible projects, the Project is considered an enhancement of the existing control technology.
